

DB/IQ MA+ Migration Aid

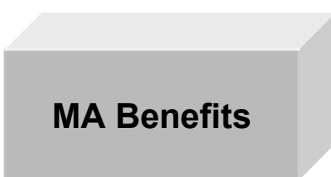

an "add on" to the DB/IQ QA product, provides fast and easy solutions to assist application development and database administration. The utilities help you utilize resources more economically and benefit your organization.

- ✓ DDLGEN function to generate DDL for objects at all levels within the DB2 Catalog structure. Observes referential integrity and generates all required foreign key specifications. Respects the DB2 privileges defined for objects considered and generates all GRANT statements as specified
- ✓ DB2 v8 NewFun mode supported – MQTs, Common Table Expressions, UNICODE, long names etc.

- ✓ DDLGEN has facilities to selectively include or exclude types of object, while generating DDL within relational (DB2 Catalog) and hierarchical structure; e.g., just create all synonyms of views or tables, which are specifically stored in table spaces residing in a certain storage group.
- ✓ REPLACE keywords and parameters allow DDL to be generated with alternative object owners, names, etc.
- ✓ creates separate data sets for generated DDL, offering flexibility for subsequent processing by DSNTIAD or even SPUFI.

- ✓ DB/IQ MA+ facilities offer the means to migrate object specifications, consistently and impartially. DBAs and project managers must simply define their needs and the migration aid will enforce them.
